

SafeSys Workflow updates for 2020/2019

Recent System Reviews

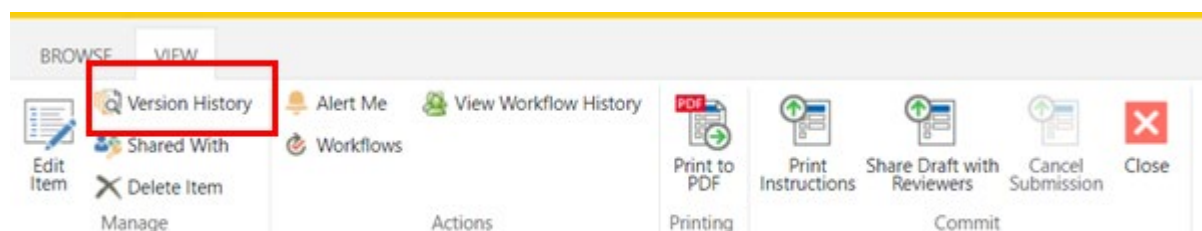

Recent SafeSys system reviews have identified workflow errors that stalled and required action by system administrators.

This occurred with multiple documents in 2019 and 2020, and the decision to restart the process was made.

Users in SafeSys may receive approvals that indicate they have come from '**svcSP13SafeSysWF**'. This is the system's name and not a person the user may know.

The IT team looking into the issue has actioned the workflows and approvers are now receiving these documents for approval.

The approval history can be always be checked using the **Version History** of a document; see document example below.
